

1.

Overfitting of polynomial matching: We have shown that the predictor defined in Equation (2.3) leads to overfitting. While this predictor seems to be very unnatural, the goal of this exercise is to show that it can be described as a thresholded polynomial.

2.

Let H be a class of binary classifiers over a domain X . Let D be an unknown distribution over X , and let f be the target hypothesis in H .

3.

Axis aligned rectangles: An axis aligned rectangle classifier in the plane is a classifier that assigns the value 1 to a point if and only if it is inside a certain rectangle.
